

Mechanical Ventilation & Heat Recovery (MVHR)

The system is designed to provide **ventilation** for a property which is airtight

It will **recover** heat which **you** produce (cooking & showering etc)

It **will not heat your house** but just make the **best use** of heat **you** have made

In cold weather **you will still need to heat your house** with the separate heaters provided

If you don't generate **any** heat your MVHR vents will blow cold air if the weather is cold!

Normal houses leak air around windows and through the roof - your house doesn't!

The MVHR system is necessary to give you the best ventilation possible in an economical way (it only costs the same as a light bulb to run). Without it your house will quickly become **black with mould**. Please contact the GHA with any further questions.
